CSE7302 - INTERNSHIP

Review-4 Presentation

TITLE OF THE PROJECT / WORK ASSIGNED / DOMAIN

Student Details	
Name	Ayush Rushi K R
Roll No	20221CSE0133
Section	8CSE05

Under the Supervision of,

Dr./Mr./Ms./Prof. Syed Mohsin Abbasi
Professor / Associate Professor / Assistant Professor
Dr. Sampath A K
Presidency School of CSE
Presidency University

Name of the Program: BTECH COMPUTER SCIENCE ENGINEERING
Name of the HoD: Dr. Blessed Prince
Name of the Program Internship Coordinator: Ms. Vidya R
Name of the School Internship Coordinator: Dr. Md Ziaur Rahman

Content

- About Company or Organization
- Working domain or the technology
- About your team and reporting Manager
- Challenges Faced in Internship
- Objectives of the work
- Literature Review
- Proposed System
- Problem Statement
- System Requirements
- Advantages of Proposed System/Work
- System Design
- System Implementation
- System Testing
- Conclusion

About Company : Prinfio Tech

- **Prinfio Tech** is a technology-driven IT company located in **Yelahanka, Bengaluru, India**, one of the major technology hubs of the country. The organization is guided by experienced technical professionals with a strong focus on practical learning, innovation, and skill development.
- Prinfio Tech specializes in cloud computing training, software development support, and automation-oriented solutions that help students and organizations enhance technical efficiency and industry readiness.

- **Food Faster** is a technology-based food delivery startup focused on fast and efficient services
- It aims to reduce delivery time and improve customer experience
- Focuses on real-time order tracking and smart delivery management
- Uses software and web technologies to optimize food ordering and delivery systems

Products & Services

- **Food Faster** is a technology-based food delivery startup focused on fast and efficient services
- It aims to reduce delivery time and improve customer experience
- Focuses on real-time order tracking and smart delivery management
- Uses software and web technologies to optimize food ordering and delivery systems

Working domain Food Technology and Web Development

- Focuses on online food ordering and delivery optimization
- Uses real-time tracking to monitor order status
- Designed to reduce delivery delays
- Integrates user, restaurant, and delivery modules
- Provides seamless communication between system components

Technologies Used

Frontend: React.js, JavaScript

- Backend: Python / Node.js
- Database: MongoDB / Firebase
- APIs: Maps API, Payment Gateway

About your team and reporting Manager

- Developed as an individual startup-based project
  - Role: Python Backend Developer
  - Responsible for developing backend logic using Python
  - Designed and implemented REST APIs for order processing
  - Managed database integration for storing user and order data
  - Handled server-side operations and request processing
  - Ensured smooth communication between frontend and backend

Challenges Faced in Internship

- Implementing backend logic for real-time tracking
  - Managing multiple requests and data flow
  - Handling API integration and errors
  - Designing efficient database structure
  - Ensuring system performance under load
  - Debugging backend and server-side issues
  - Maintaining data consistency

Objectives of the work

- To develop a strong backend system for food delivery
  - To handle real-time order processing efficiently
  - To provide fast API response and data handling
  - To manage database operations securely
  - To ensure smooth communication between modules
  - To improve system performance and scalability

Literature Review

- Traditional systems lack efficient backend processing
  - Existing systems face delays due to poor architecture
  - Real-time backend systems improve performance
  - API-based systems enhance communication
  - Database optimization improves system speed
  - Automation reduces manual intervention

Proposed System / Work

- Food Faster backend system manages all operations
  - Handles order requests from users
  - Processes restaurant and delivery data
  - Provides real-time updates using APIs
  - Stores and manages data in database
  - Ensures fast and efficient system performance
  - Improves coordination between all modules

Problem Statement

- Delay in processing orders in backend
  - Inefficient data handling in existing systems
  - Lack of real-time backend communication
  - Poor coordination between system modules
  - Increased response time affecting user experience
  - Need for optimized backend system

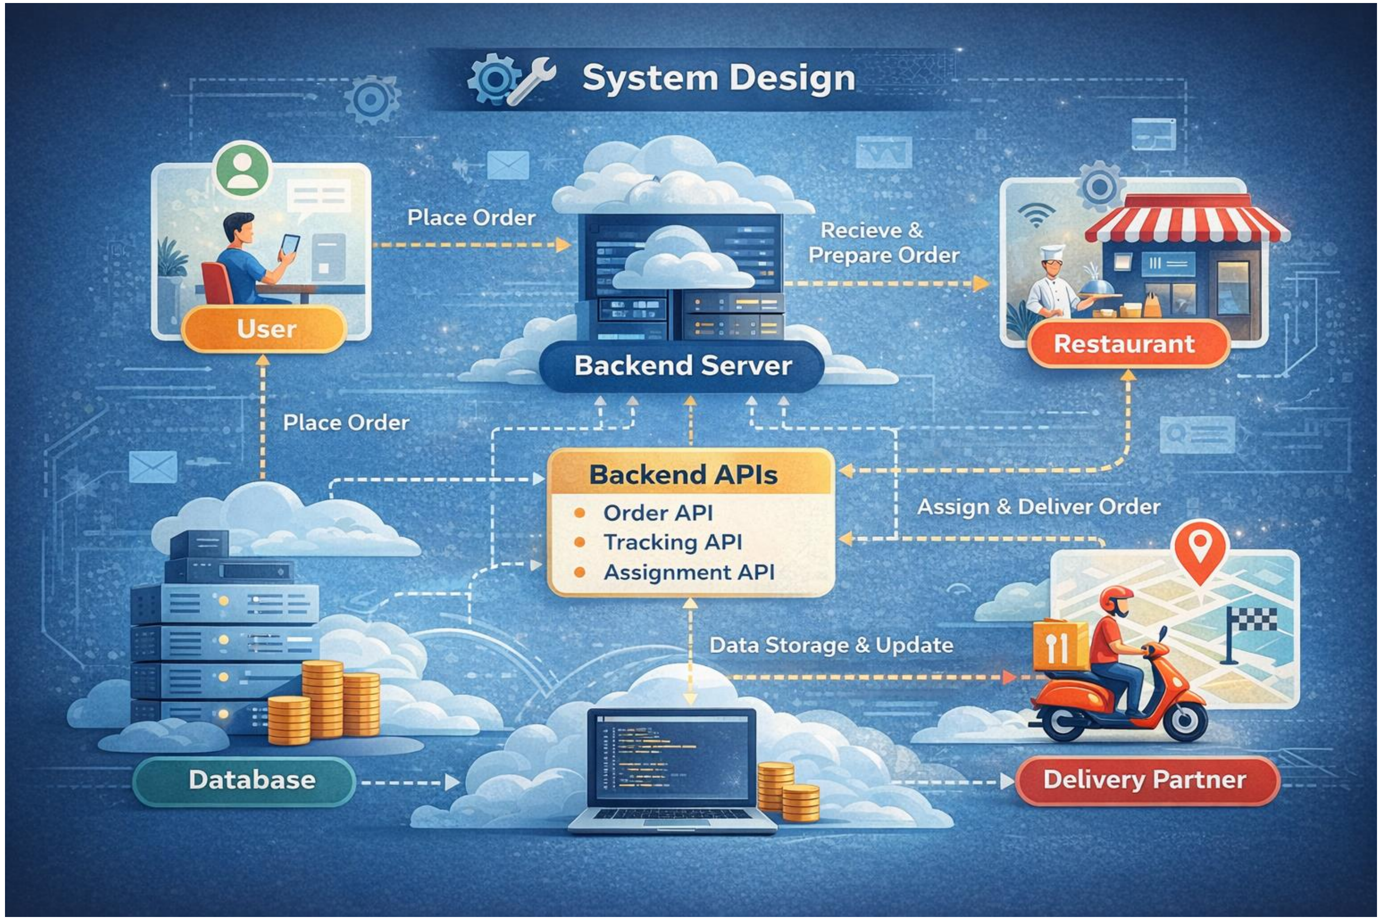
System Requirements

- **Hardware Requirements**
  - Computer / Laptop
  - Internet Connection
- **Software Requirements**
  - Backend: Python (Flask)
  - Database: MongoDB / Firebase
  - API Testing: Postman
- **Tools Used**
  - VS Code
  - Browser
  - GitHub

Advantages of Proposed System/Work

- • Fast backend processing of orders
  • Real-time data handling using APIs
  • Improved system performance
  • Efficient database management
  • Reduces delays in response time
  • Scalable backend architecture
  • Reliable and secure system

System Design



System Implementation

- **Backend Server (Flask - Python)**
- The system is implemented using a Flask-based backend server.
  It handles all business logic including order processing and delivery management.
  The server processes client requests and sends responses efficiently.
- **API Integration**
- REST APIs are developed for order placement, tracking, and user management.
  APIs enable real-time communication between system components.
  Ensures smooth data flow and fast response time.
- **Database Management**
- MongoDB/Firebase is used to store user and order information.
  All data is updated dynamically based on system activities.
  Provides efficient and scalable data storage.

System Testing

- **Types of Testing Performed:**
- **1. Functional Testing**
- Verified food order placement process
  Checked backend API functionality
  Tested order processing and status updates
  Validated data storage in database
- **2. API Testing**
- Tested REST APIs using Postman
  Verified endpoints:
  • Place order
  • Track order
  • Manage users
  • Update order status
  Ensured proper request and response handling

System Testing

- **3. Performance Testing**
- Checked backend response time
  Tested multiple user requests simultaneously
  Ensured smooth execution without delays
  Verified system performance under load
- **4. Database Testing**
- Verified data storage and retrieval
  Checked order and user data consistency
  Ensured real-time updates in database
- **5. UI Testing (Frontend)**
- Tested all pages (Login, Dashboard, Order Page)
  Verified button actions and navigation
  Checked data display from backend

Conclusion

- Successfully developed the Food Faster food delivery system
  - Implemented efficient backend using Python for order processing
  - Automated food ordering and delivery management
  - Reduced delivery time and improved system performance
  - Ensured smooth communication between frontend and backend
  - Provided real-time tracking and status updates
  - System is scalable, reliable, and user-friendly
  - Can be used in restaurants, colleges, and small businesses

Q&A
